Apesar da situação, ainda existe esperança de regeneração se todos nós tivermos consciência e começarmos a agir

We're designing the future of plastics.

PHA is a safe and guilt-free alternative to traditional plastics. We engineer bioplastics that rival the performance of traditional plastics, offering a sustainable solution to plastic pollution. Our process is lower in cost and emissions than competing bioplastics producers because we use organic waste as a feedstock.

We work with businesses to de-risk their transition to sustainable products by helping them incorporate PHA and biomaterials into new product design, so they can make a difference without sacrificing quality or profitability.
